What is Claimed:

- A method for providing notifications of changes in a database system comprising:
 creating a subscription template;
 parameterizing the subscription template to generate a parameter table; and
 performing a join between parameter table and parameterized subscription
 template to generate a query.
- 2. The method as recited in claim 1, further comprising executing an action upon performing the join, wherein the action comprises any of: performing a query and communicating data from the database system to cooperating computing applications.
- 3. The method as recited in claim 1, further comprising executing the query.
- 4. The method as recited in claim 3, further comprising retrieving data from the database system.
- 5. The method as recited in claim 4, further comprising communicating the data retrieved from the database system to cooperating services and/or computing applications.
- 6. The method as recited in claim 1, further comprising storing a subscription identification value.
- 7. The method as recited in claim 6, further comprising associating the subscription identification value with a subscriber.
- 8. The method as recited in claim 7, further comprising providing notifications to subscribers.

- 9. The method as recited in claim 1, further comprising adding additional parameters to the parameter table, wherein the additional parameters are not based on the created subscription template.
- 10. A computer readable medium having computer readable instructions to instruct a computer to perform the method as recited in claim 1.
- 11. A system to increase subscription scalability in an electronic database environment comprising:

a database system, the database system capable of accepting and processing subscriptions by cooperating services and/or computing applications, the subscriptions offering query templates for execution on database system to retrieve desired data;

a notification manger, the notification manager operating on the database system to identify changes in data in the database system and to provide notifications to the cooperating services and/or computing applications of database system changes; and

an optimization module, the optimization module using queries originating from subscribers to create subscription templates which are parameterized to create a parameter table, wherein the parameter table is joined with the subscription template to generate a notification query.

- 12. The system as recited in claim 11, wherein the optimization module comprises a computing application.
- 13. The system as recited in claim 11, further comprising a communication means, the communication means for use in communicating data between the database system and the cooperating services and/or computing applications.
- 14. The system as recited in claim 12, further comprising a spool, the spool used to spool subscription queries.

- 15. The system as recited in claim 14, further comprising a filter, the filter used to filter out subscription queries.
- 16. The system as recited in claim 11, further comprising an execution module, the execution module executing the notification query on the database system.
- 17. The system as recited in claim 11, wherein the notification manager and the database system reside in the same data environment.
- 18. The system as recited in claim 17, wherein the notification manager, the database system, and the optimization module reside in the same environment.
- 19. The system as recited in claim 11, wherein the parameter tables comprises any of query constants, subscriber identification information, and subscriber routing information.
- 20. A method for increasing subscription scalability in electronic data environments comprising:

accepting subscriptions from cooperating services and/or computing applications by a database system;

processing the subscriptions to generate query templates, the query templates having queries;

paramaterizing the query templates to generate a parameter table; and joining the parameter table with the query templates to generate a notification query.

- 21. The method as recited in claim 20, further comprising spooling the query templates.
- 22. The method as recited in claim 21, further comprising filtering the query templates.
- 23. The method as recited in claim 22, further comprising executing the notification query.

MSFT-1795 (303912.01)

PATENT

- 24. The method as recited in claim 23, further comprising communicating the results of the notification query to the cooperating services and/or computing applications.
- 25. The method as recited in claim 20, further comprising adding parameters to the parameter table not originating from the query templates.
- 26. A computer readable medium having computer readable instructions to instruct a computer to perform the method as recited in claim 20.
